Amendments to the claims:

This listing of claims will replace all prior versions and listings of claims in the application.

Listing of Claims:

1 – 12. (*cancelled*)

13. (*currently amended*) A method for the detection of ~~thyroid stimulating hormone (TSH)~~ receptor autoantibodies in a biological sample comprising:

a) contacting said biological sample with TSH receptor that is immobilized on a solid support in the presence of ~~exogenous~~ labeled ~~TSH receptor~~ affinity-purified polyclonal human autoantibodies against the TSH receptor for a time sufficient for the autoantibodies in the biological sample to competitively bind to the TSH receptor;

b) removing unbound labeled TSH receptor autoantibodies; and

c) detecting TSH receptor autoantibodies in the biological sample by measuring the amount of label bound to the TSH receptor.

14. (*new*) The method of claim 13, wherein the affinity-purified polyclonal human autoantibodies against the TSH receptor are purified to biochemical homogeneity and have a specific activity of at least 1 IU/mg of protein.

15. (*new*) The method of claim 13, wherein the affinity-purified polyclonal human autoantibodies against the TSH receptor are obtained by purification by affinity chromatography, from a pool of sera of Graves' disease patients, wherein said autoantibodies are bound to an affinity material having a functional human recombinant TSH receptor bound thereto, washed to remove unbound autoantibodies and then eluted from the affinity material.

16.   (*new*) The method of claim 13, wherein said affinity-purified polyclonal human autoantibodies against the TSH receptor are labeled with a radioisotope, a chemiluminescent label or a fluorescent label.

17.   (*new*) The method of claim 16, wherein said affinity-purified polyclonal human autoantibodies against the TSH receptor are directly or indirectly labeled.
